土田肇**

要　　旨

わが国の港湾地域における強震観測は、昭和37年度より港湾技術研究所耐震構造研究室が中心となり、運輸省港湾局、各港湾建設局、北海道開発局港湾部、岩手県、静岡県、宮崎県の各港湾課、東京都、大阪市の各港湾局の協力のもとに実施している。観測網には、昭和45年末現在で57台の強震計が、36港に配置されていた。このうち、39台は地盤上に、また残り18台は構造物上に設置されていた。使用している強震計はSMAC-B2強震計および当研究室で開発したERS強震計の2種である。

この報告では、前記観測網で昭和46年中に得られた記録のうち、対応する地震がはっきりせず、かつその最大加速度が20 gal以下のものを除き、残りすべてを地震ごとに分類し、地震の資料と各成分ごとの最大加速度を添えて、強震観測表(Strong-Motion Earthquake Observation Results)に示した。強震観測表の地震資料(Earthquake Data)に示すものは、備考(Remarks)を除き、気象庁地震課発行の地震月報によっている。また、地盤上における記録で最大加速度が20 gal以上のものについては、アナログ記録として、後で説明する方法により数字化した記録を電子計算機により自動的にプロットしたものを示した。最大加速度が20～50ガルの範囲の記録については水平2成分を、50ガル以上の記録については3成分を示した。最大加速度が50ガル以上の記録と50ガル以下の記録では、アナログ記録の縦軸の縮尺が変わっていることに注意されたい。各成分の記録の上下にN、S、等の方向を示す記号が書き込まれている。これは、地盤が正弦波状の運動をし、その振動数が加速度計振子の非減衰固有振動数より小さいとき、地盤の運動の加速度の方向を示すように記入してある。観測地点によっては、記録の1成分を構造物法線と平行にしたために、強震計のNS成分が真北を指していないものがある。この偏角や設置地点の条件等については、別に報告されているので参照されたい。

これまでの年報では、原記録より直接製版して印刷した記録の原寸複製を載せた。しかし、強震観測事業推進連絡会議が諸機関の観測網で得られた記録の原寸印刷を刊行するようになった。そこで、本報告では、数字化された記録等の利用者がそれぞれの利用目的に適した記録を選び出すときの資料として、電子計算機によりプロットしたものを示した。

最大加速度が50ガル以上の記録については、応答スペクトル、フーリエスペクトルおよび数字化された記録を添えた。

* 構造部 耐震構造研究室

** 構造部 耐震構造研究室長

数字化された記録は原記録の密着印画を数字化装置により 0.01 秒ごとに読み取り、円弧補正を行なった上で再び 0.01 秒間隔の数値として示したものである。

応答スペクトルは数字化された記録から主要部分を取り出し、これについて 1 自由度 1 質点系の最大応答を求めてプロットしたものである。最大応答の計算は理論解を一定時間毎で数値計算し、その最大値を求める方法によった。時間毎隔は 0.01 秒を原則としたが、固有周期の短い部分では、時間毎隔が固有周期の $1/20$ 、もしくはそれ以下となるようにした。応答スペクトルの計算に用いた地震波の長さは TIME LENGTH、記録の始めの部分で加速度が小さいので計算に用いなかった部分の長さは SKIPPED LENGTH として、数値表中に示してある。

この報告に示すフーリエスペクトルは、地震波の最大加速度の部分を含む数秒間を取り出し、これをフーリエ級数に展開して、そのフーリエ係数をプロットしたものである。したがって、厳密には線スペクトルであるが、図では各スペクトル値を結んだ形にしてある。フーリエスペクトルを求めた区間の始点と記録の始点との時間は TSK、スペクトルを求めた区間の長さは TUS として、秒を単位とする数値で図中に示してある。

港湾地域強震観測では、昭和 37 年度に観測を開始して以来、昭和 46 年末までに約 660 本の記録を得た。それらの主なものは、本年報に示すと同様の手法で整理解析され、刊行されている。得られた記録の本数を観測地点ごとに集計し、数字化されている記録とそれが刊行された港湾技術資料の番号を表 (Table 4) として示した。

ANNUAL REPORT ON STRONG-MOTION EARTHQUAKE RECORDS IN JAPANESE PORTS (1971)

Eiichi Kurata*,
Tokuzo Ishizaka*,
Hajime Tsuchida**

Synopsis

In the major ports in Japan, the strong-motion earthquake and the earthquake response of structures have been observed for these ten years; and as of December 1971, more than 660 accelerograms were accumulated and analysed in the Earthquake Resistant Structures Laboratory. The observation network consisted of 57 strong-motion accelerographs; the 39 accelerographs were on the ground and the rest on the structures. Two types of accelerograph, the SMAC-B2 accelerograph and the ERS accelerograph were being used. This report presents all the records obtained in 1971, which are listed in the tables with their maximum accelerations, being classified in accordance with earthquakes. The accelerograms of ground motions with maximum accelerations exceeding 20 gals are reproduced in form of computer plots. On the ground acceleration records with maximum accelerations larger than 50 gals, digitized records, response spectra and Fourier spectra are included.

1. Introduction

The observation of the strong-motion earthquake in major ports was started in 1962 in Japan by the Earthquake Resistant Structures Laboratory of the Port and Harbour Research Institute. The observation network was expanded year by year; and as of December 1969, 57 accelerographs had been installed in 36 ports. Two types of accelerograph were being used, namely the SMAC-B2 accelerograph and the ERS accelerograph.

Until the end of 1971, more than 660 accelerograms had been obtained in the network and collected in the Laboratory for preliminary processing and analyses which would be explained later on. The records from 1963 to 1970 had been published in the previous annual reports which had similar format to the present one. 1, 2, 3, 4, 5, 6) In 1968, there occurred an earthquake of large magnitude, the 1968 Tokachi-Oki earthquake; and large number of aftershocks followed. The damage took place to buildings, roads, port facilities and many other types of structure. The largest acceleration was recorded at Hachinohe Port, which was 259 gals. Because of the large magnitude of the earthquake and the damage to structures, the records were of great interest and importance. Therefore, the authors published a report of similar format to the annual report. 7)

The records and the results of the preliminary analyses in those reports have been used very effectively for analyses of the earthquake damage, for analyses of earthquake response of structures and also for designing large piers; and the usefulness of the strong-motion earthquake observation has been perfectly proved.

* Members of Earthquake Resistant Structures Laboratory, Structures Division

** Chief of Earthquake Resistant Structures Laboratory, Structures Division

The report consists of the Strong-Motion Earthquake Observation Results, reproduced accelerograms, digitized records, response spectra and Fourier spectra. All the records in 1971 are listed in the Strong-Motion Earthquake Observation Results with their maximum accelerations, except a few number of records whose earthquakes are not known and whose maximum accelerations are less than 20 gals. The computer plots of digitized records are prepared for the ground acceleration records with maximum accelerations exceeding 20 gals; the digitized records and the spectra are provided only on records exceeding 50 gals. Those of the 1968 Tokachi-Oki earthquake and its three major aftershocks are not published in the series of annual reports, since those have been published separately.

Following organizations are being cooperated with the Port and Harbour Research Institute in the strong-motion earthquake observation:

The Bureau for Ports and Harbours of the Ministry of Transport;
The Regional Bureaus for Port Construction of the Ministry of Transport;
The Port and Harbour Division, Hokkaido Development Bureau, Hokkaido Development Agency of the Prime Minister's Office;
The Harbour Sections of Iwate, Shizuoka, and Miyazaki Prefectural Governments;
and
The Harbour Bureaus of Tokyo and Osaka Municipal Governments.

2. Network and Instrument

(1) Network

The network of the Port and Harbour Research Institute were covering the coast-line of Japan with 57 strong-motion accelerographs in 1971; the location of ports where the accelerographs are installed, are shown in Fig. 1. The numbers attached to the ports in Fig. 1 are corresponding to the numbers in Table 1. In Table 1, being classified in accordance with the ports, the stations are listed with the type of accelerograph, the installation condition, and the reference number. The reference number is showing the number of the Technical Note of the Port and Harbour Research Institute in which the site condition of each station is described. 8, 9)

The accelerographs at the 45 stations out of the 57 stations were the SMAC-B2 accelerographs and the rest, the ERS accelerographs. The details of both accelerographs can be seen in the previous reports. 10, 11)

(2) Servicing

The installation and the servicing of the network have been made by the port construction offices of the previously described organizations under the direction of the Earthquake Resistant Structures Laboratory. It is directed that the instrument should be checked at least twice a month and after an earthquake larger than the intensity II as soon as possible. The accelerogram is sent carefully to the Earthquake Resistant Structures Laboratory by post or in hand, without any treatment or reading in the station, to eliminate possible danger to damage the accelerogram by unaccustomed persons to handle it.

The Earthquake Resistant Structures Laboratory has been offering every year a training course of 5 days to the persons who take care of the accelerographs in the stations. During the course, the trainees are instructed proper procedure to maintain the instruments and to handle the accelerograms, by the experts from the manufacturing companies of the

Fig. 1 Location of ports where the accelerographs are installed. (The numbers to each port are corresponding to the numbers in Table 1.)

* The numbers correspond to those in Fig. 1.

** The numbers correspond to those of the Technical Note of the Port and Harbour Research Institute, in which the site condition of the station is given.

accelerographs. They also attend introductory lectures to the earthquake engineering by the instructors inside and outside of the Institute.

(3) Stations

In the network, there are two kinds of stations; one is to record the ground acceleration, the other to record the earthquake response of structures. The station to record the earthquake response is always accompanied with another station to record the ground acceleration in its vicinity.

In the stations recording the ground acceleration independently, one of the horizontal components of the instrument is directed due north except a few number of instruments which have been installed in parallel with the structures. It is the reason that in the ports where the instruments are installed in parallel to the structures, there are many quaywalls or piers parallel each other, and that it is desirable to record components of the ground acceleration in parallel and perpendicular to the axes of the structures. In the stations recording structural response and the accompanying stations recording the ground acceleration, the instruments are installed parallel to the structures whose earthquake response is needed. As two horizontal components of the accelerographs are named NS and EW always, the direction of the NS-component makes an angle to the due north direction in some of the accelerographs in the network.

Each station in the network has its own abbreviated name which implies its location, the type of its accelerograph and installation condition, on the ground or on the structure. For instance, the station in Hachinohe Port is named Hachinohe-S in which Hachinohe is the name of the place where the station is located and the capital letter S at the end of the abbreviated name is showing that the accelerograph in the station is the SMAC-B2 accelerograph. If the ERS accelerograph is being used in a station, the name of the place is followed by a capital letter M. As this naming is made to distinguish the stations accurately in the network, it may be a little difficult for the people outside the network to imagine the location from its name, especially for the people who does not understand the Japanese language. The detailed publication on the network will help those people to find the location as well as other necessary data of the station. 8, 9)

(4) Accelerographs

Two types of accelerograph are being used in the network, they are the SMAC-B2 accelerograph and the ERS accelerograph. The ERS accelerograph consists of two electro-magnetic transducers equipped horizontally and a recording device. There are two models on the ERS accelerograph; the ERS-A accelerograph has a magnetic tape data recorder and the ERS-B an electro-magnetic oscilloscope. They were developed by the Earthquake Resistant Structures Laboratory. The details of the SMAC-B2 and the ERS-A accelerographs were reported in the separate reports. 10, 11)

The triggering levels of the accelerographs in the network are 5 gals in places where ground noise is small and 8 gals in places where ground noise is relatively large because of heavy motor trucks for construction work or cargo transportation. Exceptionally a few number of the accelerographs located beside roads carrying very heavy traffic are triggered at 11 gals.

(5) Foundation and Housing

All the accelerographs in the network are installed on simple shallow foundations which were designed based upon the same idea. It was supposed that the shape and the dimensions of a foundation on which a seismograph is installed affects to the earthquake record obtained by it. However, as there was no convincing idea to design the most suitable foundation, the foundations of almost same size and of same shape were selected for all the accelerographs in the network. This makes it easier to compare accelerograms of an earthquake recorded at several stations. As the most of the harbour structures have shallow foundations and do not rest on bed rock, it was decided to make shallow foundations for the accelerographs, as shown in Fig. 2. The hollow space under the foundation was made to make the bulk density of the foundation equal to that of the soil, so that the disturbance to the records due to the foundation is eliminated.

Usually, no pile is used to support the accelerograph and its foundation, but in the stations on very soft soil or loose sand, concrete piles or wooden piles were used. For example, the foundations in the Hachinohe-S station and the Niigata-S station are supported by piles. The foundation is isolated from a housing covering the instrument.

The most of the accelerographs are covered with housings which were built for the instruments. Some of the accelerographs were installed in houses which had been built for other purposes. The housing built for the instruments are made of reinforced concrete or concrete blocks; some are prefabricated houses. In Photo 1, as an example, the housing of the Ofunado-bo-chi-S station is shown.

3. Accelerogram Processing

(1) Preliminary Processing

The accelerograms collected at the Earthquake Resistant Structures Laboratory are listed in the tables "Strong-Motion Earthquake Observation Results", through the following processing.

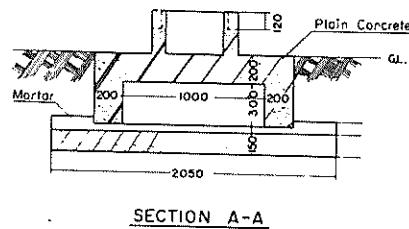

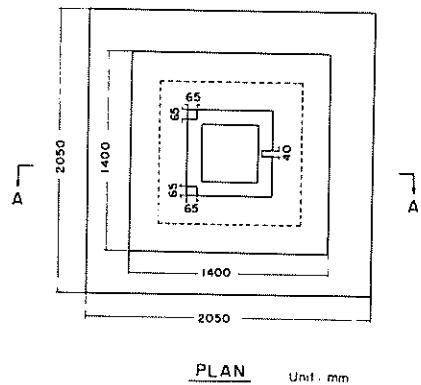

Fig. 2 Foundation for
 Accelerograph
 (SMAC-B2)

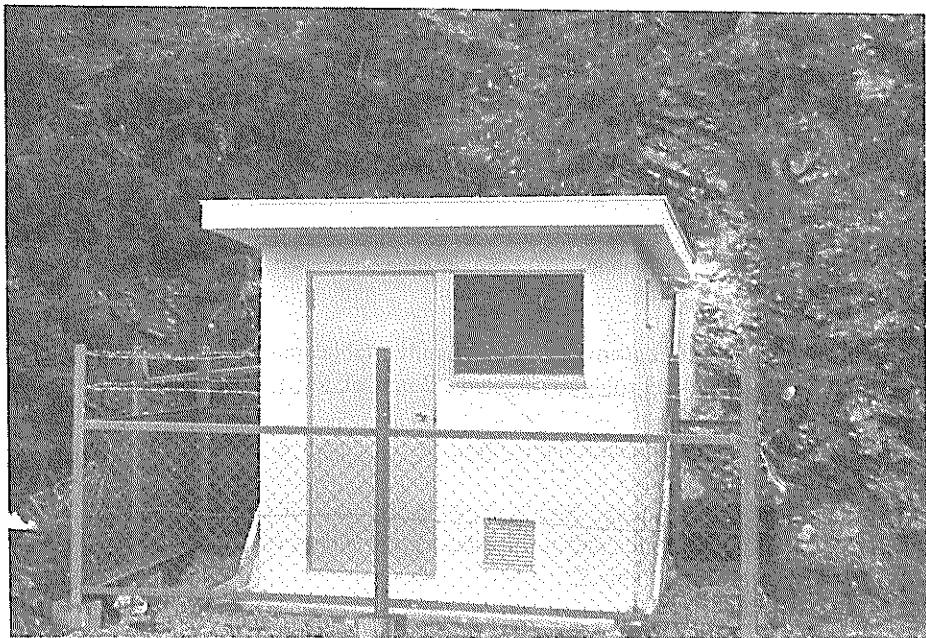

Photo 1 Housing of Ofunato-bo-chi-S

At first, each accelerogram is given a record number according to the order of its arrival at the Laboratory. The record number for the accelerogram from the SMAC-B2 accelerograph begins with a capital letter S; and that from the ERS accelerograph, with a capital letter M.

Then, the earthquake corresponding to the accelerogram is confirmed or determined. Most of the accelerograms are sent from the stations with information on the earthquake for which the accelerograms have been obtained. But a few of the accelerograms are sent without such information because the accelerograms have been found in the regular servicings, and at the station it is difficult to find the corresponding earthquake. For the accelerogram without the information, the earthquake is determined considering the possible period of the recording and the earthquakes occurred in that period. The determination or the check is made based on the Seismological Bulletin of the Japan Meteorological Agency. Some of the accelerograms are impossible to determine their corresponding earthquakes even in the Laboratory and they are treated as earthquake unknown. It will be noted that the reliability of the earthquake determination for accelerograms of small acceleration is limited because of such procedure.

A direct copy is made from the original accelerogram and the maximum accelerations of each component are read with the aid of a magnifying glass. In this reading the base-line setting is not so accurate as that made in digitizing the accelerogram, since this is just preliminary processing. The difference between two accuracies in base-line setting, may cause a little difference between the maximum accelerations read with the magnifying glass and in the digitized record.

The accelerograms are classified in accordance with the earthquakes, and listed with their maximum accelerations in the tables "Strong-Motion Earthquake Observation Results". The items in the table will be explained in the following sub-sections. The Strong-Motion Earthquake Observation Results is compiled every two months and sent to all the stations. The copy of the accelerogram is also sent with the necessary direction on the maintenance of the instrument to the station where the accelerogram was obtained. The Strong-Motion Earthquake Observation Results are included in the later part of this report.

(2) Earthquake Data

The earthquake data except the remarks in the table are based upon the Seismological Bulletin of the Japan Meteorological Agency. Some of the remarks come from different sources.

The time in the earthquake data refers to the Japan Standard Time (JST) which is earlier than GMT by 9 hours.

The class in the earthquake data is showing the scale of the earthquake based on the distance between the epicenter and the furthest point where the shock is felt. The classification criteria are shown in Table 2.

Table 2 Classification of Earthquakes (After Ref. 12)

Remarkable earthquake:

Distance of furthest point where shock is felt, is greater than 300km.

Moderate earthquake:

The distance is smaller than 300km, but greater than 200km.

Earthquake of small felt area:

The distance is smaller than 200km, but greater than 100km.

Local earthquake:

The distance is smaller than 100km.

The magnitude in the earthquake data is determined using Tsuboi's formula:

$$M = \log(A_N^2 + A_E^2) + 1.73 \log d - 0.83 \dots \dots \dots \quad (1)$$

where, M is the magnitude; A_N and A_E are the maximum amplitudes of N-and E-components in micron respectively; and d is the epicentral distance in km. Those ground amplitudes are of seismometers with periods of about 5 seconds, and of waves shorter than 5 seconds. The magnitude is the averaged value over magnitudes for every $\sqrt{A_N^2 + A_E^2}$ reported by the stations of JMA.

The intensity of the shock is estimated according to the scale as shown in Table 3.

Table 3 JMA Seismic Intensity Scale (After Ref. 12)

0: NO FEELING

Shocks too weak to cause human feelings and registered only by a seismograph.

1: SLIGHT

Extremely feeble shocks only felt by persons at rest or by those who are observant to an earthquake.

2: WEAK

Shocks felt by most persons, slight shaking of doors and Japanese latticed sliding doors (shoji).

3: RATHER STRONG

Slight shaking of houses and buildings, rattling of doors and Japanese latticed sliding doors (shoji), swinging of hanging objects like electric lamps, moving of liquids in vessels.

4: STRONG

Strong shaking of houses and buildings, overturning of unstable objects, spilling of liquids out of vessels.

5: VERY STRONG

Cracks in the walls, overturning of gravestones, stone lanterns etc., damage to chimneys and mud-and-plaster warehouses.

6: DISASTROUS

Demolition of houses by less than 30% in total number, landslips, fissures in the ground etc.

7: VERY DISASTROUS

Demolition of houses by more than 30%, intense landslips, large fissures in the ground, faults.

(3) Accelerograph Results

The items in the accelerograph results have been explained previously. The maximum accelerations are those determined by the preliminary processing.

The accelerogram whose earthquake is unknown is not listed in the table, if both of its maximum horizontal accelerations are smaller than 20 gals. If at least one of the maximum accelerations is larger than 20 gals, then it is listed in the table, but the earthquake data can not be given.

4. Analog Record

Analog reproduction of the records with maximum acceleration exceeding 20 gals are presented in the later part of this report. They are computer plots of digitized records which are processed in the procedure explained in the following section. For the records with maximum accelerations ranging from 20 to 50 gals, only horizontal components are shown; and for those exceeding 50 gals, three components are shown. It should be noted that in the analog records the scaling of acceleration amplitude are different for the records exceeding and not exceeding 50 gals.

The direction written above and below each trace corresponds to the direction of the ground acceleration when the ground motion is harmonic one of frequency lower than the natural frequency of the pendulum of the accelerograph.

In the previous reports on the observations before 1970, the reproduced accelerograms which were the offset prints from the original accelerograms, were included. However, the Strong-Motion Earthquake Observation Council whose secretariat is in the Planning Section of the National Research Center for Disaster Prevention began to publish analog reproductions of accelerograms obtained in the networks of different organizations. 13) As the accelerograms obtained in the network of the Port and Harbour Research Institute are

included in it, this report does not contain the analog reproductions from the original accelerograms. However, to give visual impressions to the person who wish to use the digitized records in this report, the computer plots of the digitized records are prepared.

5. Digitized Record

The Earthquake Resistant Structures Laboratory intends to digitize all the accelerograms with maximum acceleration larger than 20 gals in the following procedure. As all of the digitized records in this report were obtained on the SMAC-B2 accelerograph, the procedure only for the accelerograms from the SMAC-B2 accelerograph will be described.

The direct copy of the accelerogram is made with the special photographic film whose base is stable against temperature and humidity. On the copy, the trace is black line and the background is semi-transparent. If the significant portion of the record is longer than 60 cm, the copy will be two sheets or more; more than 10 cm of the record on the both sides of the sheet is overlapping in the successive sheets.

With this copy, the record is digitized at equal time intervals of 0.01 second with an accelerogram digitizer as shown in Photo 2, which was designed especially for digitizing the accelerogram obtained on the SMAC-B2 accelerograph. If the portion to be digitized is longer than about 30 cm, the copy must be shifted on the table of the digitizer.

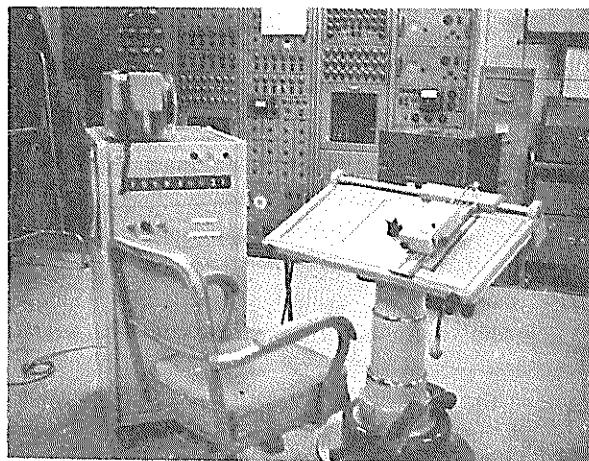

Photo 2 Accelerogram Digitizer

The acceleration is digitized in a rectangular co-ordinates and perforated on paper tape in the flexo writer code. Then the values are again perforated on paper tape in special code with a digital computer and converted into analog electronic voltage with a digital-analog converter. The output from the converter is recorded by an ink-writing oscillograph in appropriate amplitude. Then, the record is carefully examined whether any fault in the digitizing or in the base-line setting exists or not. If there is any fault, it is corrected in the digital computer. As the pen of the SMAC-B2 accelerograph moves along an arc and the

record is digitized in a rectangular co-ordinates, the arc error introduced in the digitizing in time values is corrected at the same time. The acceleration values are not corrected since the sensitivity of the SMAC-B2 accelerograph is the ratio of the acceleration to the displacement of the pen measured at a right angle to the base-line.

After the correction, the digitized accelerations are series of values at unequal time intervals, but they are converted into values at equal time intervals by means of linear interpolation. The reason to make the digitized record at equal time intervals is that the records obtained by the ERS-A accelerograph are always digitized at equal time intervals with an analog-digital converter and it is convenient to have digitized records in one standard form for application of them. The digitized record at equal time intervals is also convenient for converting them with a digital-analog converter into analog electronic voltage which is used as an input to an analog computer.

The final results are printed on paper as seen in the last part of this report and also written on a magnetic tape for future use.

6. Preliminary Analyses

(1) Response Spectrum

The response spectra in the previous annual reports before 1968 were calculated from the digitized records by a digital computer using the Runge-Kuta-Gill method to integrate numerically the equation of motion of the oscillator. The response spectra in the present report were calculated with a step by step calculation of the exact solution to the governing differential equation. 14) No significant difference was seen in the results calculated by the both methods, according to the trial calculations.

The time interval of each step of the calculation is 0.01 second for the oscillators of natural periods longer than 0.2 second. For the oscillators of shorter periods, the small time intervals are selected so that one cycle of the undamped free oscillation of the oscillator is covered at least by 20 steps of the numerical calculation, to maintain the necessary accuracy. In these calculation, the digitized records at smaller time intervals are made by means of the interpolation in the computer. The response spectra are provided in numerical tables as well as in the figures.

To calculate the response spectrum, entire length of the record is not necessary; the last part of the record after the maximum response have appeared, is practically meaningless in the response calculation. Besides, the shorter record is more preferable from view point of the calculation time. On some long records, their beginning parts of small acceleration are not used in the calculation so far as it is thought that the neglected parts do not affect the results of the calculation. The length of the record used for the calculation and the length of the beginning part which is not used, are shown in the numerical table as the time length and the skipped length respectively.

Although the smallest natural period in the response spectra in this report is 0.05 second, the spectral values for the shorter natural periods should be used taking the frequency characteristics of the SMAC-B2 accelerograph in mind. The ERS accelerograph has wider frequency range than that of the SMAC-B2 accelerograph and such caution is not necessary on the response spectra of the record by the ERS accelerograph.

(2) Fourier Spectrum

The Fourier spectra in this report are plots of the coefficients of the real Fourier series versus the periods. The real Fourier series of a periodic function is expressed by the following equation:

$$f(t) = a_0 + \sum_{m=1}^{\infty} (a_m \cos \frac{2\pi m}{T} t + b_m \sin \frac{2\pi m}{T} t) \dots \quad (2a)$$

$$a_0 = \frac{1}{T} \int_0^T f(\tau) d\tau \dots \quad (2b)$$

$$a_m = \frac{2}{T} \int_0^T f(\tau) \cos \frac{2\pi m}{T} \tau d\tau \dots \quad (2c)$$

$$b_m = \frac{2}{T} \int_0^T f(\tau) \sin \frac{2\pi m}{T} \tau d\tau \dots \quad (2d)$$

in which $f(t)$ is the periodic function; and T is the period. Although this series is, in principle, applicable only to a periodic function and no earthquake is periodic, the coefficients a_m and b_m are calculated on the most significant part of the records. The resultant c_m of the two coefficients are plotted in the figures which will appear in the later part of this report. The coefficient c_m given by,

$$c_m = \sqrt{a_m^2 + b_m^2} \dots \quad (3)$$

is a discrete quantity against the period; in the figures however, the successive values are connected with straight lines to show the shape of the spectrum as a whole.

The length of the record used for the spectrum calculation are usually 5 seconds including the maximum acceleration. In the figures, TSK indicates the beginning of the used part for the calculation counted from the starting point of the digitized record in second; TUS indicates the length of the used part in second.

The Fourier spectrum in this report have been provided temporarily to give engineers the information to select the most appropriate record for their response calculation. In the future routine analyses of the Laboratory, the Fourier spectra described previously, will be replaced with more suitable spectra to represent the frequency characteristics of the strong-motion earthquake record.

7. Summary of Observation

Since 1962, more than 660 records were obtained in the network of the Port and Harbour Research Institute, and most of the important records were analysed by the authors. In Table 4, a statistical summary of the records from the SMAC-B2 accelerographs is given. In the table, record numbers of accelerograms of which the digitized records and the spectra have been published are shown. The number in the parentheses behind each record number is showing the number of the Technical Note of the Port and Harbour Research Institute in which the digitized record appeared.

The results of the observation and analyses are being used widely for designing structures and earthquake engineering research. For examples, the results were used to compile the average response spectra depending upon subsoil conditions and to study effects of vertical ground motions to stability of rigid structures during earthquakes. 15, 16)

Table 4 Statistical Summary of the Obtained Records on the SMAC-B2 Accelerographs

* Reference No. corresponds to the number of the Technical Note of the Port and Harbour Research Institute in which the digitized record appeared.

Acknowledgements

This report largely depends upon the people who serviced the instruments so effectively, although they have handful daily jobs and the servicing is quite additional. Their efforts should be appreciated not only by the authors but also by all the people who receive any benefit from the report. The authors also wish to express their appreciation to the organizations in concern, for their considerable supports to the observation.
